1 Introduction

Brief introduction to the project and objectives.

2 Task 1

Our group created a shared GitHub repository for the project. The repository is used to store code and project files, allowing all members to contribute and track changes through version control. This setup helps document each member's contributions and supports collaborative development throughout the course. The repository can be accessed here: [Inf-203 GitHub repository](#)

3 Task 2

We created a requirements register using a spreadsheet to manage the system requirements. The requirements are structured using an Agile approach with epics and user stories, and are prioritised using the MoSCoW method.

Two main epics were defined: *Data Processing and Output* and *User Feedback and Support*. Each epic contains user stories describing system functionality from different user perspectives. The requirements include three personas: Student, Teaching Assistant, and Teacher. The requirements register will be maintained throughout the project and updated as the system is developed and refined. The report can be accessed here: [Inf-203 Latex Report](#)
